

***C. elegans* length measurements comparison between WorMe and manually obtained with Fiji ImageJ, applying the manual bias error in WorMe.**

In this little experiment we check if the measures between manually obtained by Fiji and automatically obtained with WorMe have the same means.

We have data of three different *C. elegans* sets of images: C24, C48 and C72. Every set is different time of development of *C. elegans*, and different images characteristics.

In the study we show the measurements obtained from **WorMe applying the manual bias error** is the same than the measurements obtained manually from the ImageJ. The manual bias error is actioned when despite of obtain the length from the euclidean distance between every pixel in the skeletonized line of *C. elegans*, we obtain this length every 5 pixels, emulating the manual polyline measurement.

First, we study the normality of the data, and then we visualize boxplot and histogram between every set of sample (C24, C48 and C72), between the measurement automaticaly by WorMe and the measurement obtained manually by imageJ.
